

Sample Input for [www.google.com](http://www.google.com):

So when I'm in the directory where the .py file is I get the output when I run

py mydig.py [www.google.com](http://www.google.com)

Important point is that my function takes 1 argument which would be the url you want to resolve.

Sample Output for [www.google.com](http://www.google.com)
